# Table of Contents

Command Format Conventions	1
Commands That Do Not Affect a Suspended User Program	2
Commands Covered in Other Books	4
PRIMOS Commands (in Alphabetical Order)	6

## Note

In response to user requests, a new Programmer's Companion has been created. This book, the **CPL Programmer's Companion**, contains information formerly in the **PRIMOS Commands Programmer's Companion** on Command Functions and CPL directives.

## Printing history:

May 1978, First Printing

August 1979, Second Printing, Revisions

May 1980, Third Printing

July 1980, Fourth Printing, Revisions

July 1981, Fifth Printing, Revisions

July 1983, Sixth Printing, Revisions

# Command Format Conventions

**Uppercase:** Commands or keywords that must be entered literally are printed in uppercase letters

DATE [ option ]

**Lowercase:** Lowercase letters identify parameters  
The user substitutes an appropriate numerical or text value

ATTACH pathname

**Abbreviations:** The system-defined abbreviation of a PRIMOS command is shown in rust-colored letters

LOGOUT

**Braces { }:** Braces indicate a choice of parameters and/or keywords. At least one choice must be selected

CHAP { UP  
DOWN }

**Square brackets [ ]:** Square brackets indicate that the word or argument enclosed is optional

PRINT [n]

**Parentheses ( ):** Parentheses in a command must be entered literally

PUNCH (ASR)

**Hyphen -:** A hyphen identifies a command line option

SPOOL -LIST

**Ellipsis :** An ellipsis means that the preceding parameter can be repeated

CLOSE -UNIT unit-1 [ unit-n ]

**Angle brackets < >:** Angle brackets are used literally to separate the elements of a pathname

<FOREST>BEECH>BRANCH537>TWIG43>LEAF4

---

## Commands That Do Not Affect A Suspended User Program

You can restart a suspended user program by using the START command. If you intend to restart a program, you may use only the commands on the following list before doing so.

ABBREV	LIST_GROUP
ADD_REMOTE_ID	LIST_PRIORITY_ACCESS
ASRCWD	LIST_QUOTA
ASSIGN	LIST_REMOTE_ID
ATTACH	LIST_VAR
BINARY	LON
CHANGE_PASSWORD	MESSAGE
CHAP	OPEN
CLOSE	ORIGIN
CNAME	PASSWD
COMINPUT	PHANTOM
COMOUTPUT	PM
COPY	PRERR
CREATE	PROTECT
DATE	RDY
DEFINE_GVAR	REN
DELAY	RESTOR
DELETE	RESUME
DELETE_VAR	REVERT_PASSWORD
DELSEG	RLS
DMSTK	RSTERM
DROPDTR	RWLOCK
EDIT_ACCESS	SAVE
HELP	SET_ACCESS
INPUT	SET_DELETE
LD	SET_QUOTA
LISTING	SET_VAR
LIST_ACCESS	START

**STATUS**  
**SVCSW**  
**TIME**  
**TYPE**

**UNASSIGN**  
**USERS**  
**VRTSSW**

All other commands are considered to be user programs. This means that you cannot restart a suspended program after using a command that is not on this list.

---

## Commands Covered In Other Books

The following commands are not covered in this book. Refer to the appropriate guides for further information.

### COMMUNICATIONS SUBSYSTEMS

See the **Remote Job Entry Phase II Guide** for:

RJQ	RJOP
-----	------

See the **DPTX Guide** for:

OWLDSC	PT45DSC
PRTDSC	TCF

### DBMS SUBSYSTEMS

See the **DML Reference Guide** for:

CDML	FDML
------	------

See the **DDL Reference Guide** for:

CSUBS	SCHEMA
FSUBS	

See the **DBMS Administrator's Guide** for:

CLUP	SCHDEC
DBACP	SCHED
DBUTL	

### FORMS SUBSYSTEMS

See the **FORMS Programmer's Guide** for:

FAP	FDL
-----	-----

See the **FED User's Guide** for:

FED

# MIDAS SUBSYSTEMS

See the **MIDAS User's Guide** for dialog information about:

CREATK	MCLUP
KBUILD	MPACK
KIDDEL	

# POWER SUBSYSTEMS

See the **PRIME/POWER Guide**.

# SYSTEM OPERATOR COMMANDS

The following commands are for the system operator. Most can be issued only from the supervisor terminal. See the **System Administrator's Guide** or the **System Operator's Guide**.

ADDISK	NETCFG
AMLC	OPRPRI
BOOT_CREATE	PHYRST
CONFIG	PHYSAV
COPY_DISK	PRIMOS
DISKS	PRINT_NETLOG
DPTCFG	PRINT_SYSLOG
DPTX	PROP
ELIGTS	REMOTE
EVENT_LOG	REMOVE_PRIORITY_ACCESS
FIX_DISK	REPLY
FIXRAT	SETIME
FTGEN	SETMOD
FTOP	SET_PRIORITY_ACCESS
LOGPRT	SHARE
LOOK	SHUTDN
MAKE	STARTUP
MAXSCH	USAGE
MAXUSR	USRASR
NET	

---

# PRIMOS Commands

► **ABBREV [ pathname ][ options ]**

Allows users to create and use abbreviations for PRIMOS commands and their arguments. **ABBREV** **pathname** activates an existing abbreviation file. **ABBREV** has the following options:

To create a file

**-CREATE**

Creates and activates an empty abbreviation file. **pathname** must be supplied with this option.

To activate and deactivate files

**-OFF**

Turns off abbreviation expansion.

**-ON**

Turns expansion on again.

**-VERIFY**

Displays each expanded command line at the terminal before executing it.

**-NO\_VERIFY**

Turns off verify mode (Default).

**-EXECUTE rest-of-line**

Passes **rest-of-line** to the command processor for execution without expanding it.

**-EXPAND rest-of-line**

Expands **rest-of-line** and displays it on the terminal but does not execute the expanded line.

**-EXPAND\_EXECUTE**

Expands **rest of-line** and passes it to the command processor for execution.

To monitor files

**-LIST [ name 1 [ name-n ] ]**

Lists the specified abbreviations from the current abbreviation file. If no names are given, lists the complete file. **names** can be wildcard names.

## **-STATUS**

Displays the name of the current abbreviation file and the number of abbreviations it contains

To add change or delete abbreviations

## **-ADD name value**

Adds the abbreviation **name** to the current file and gives it the specified **value**. The abbreviation is expanded when it occurs anywhere on the line

## **-ADD\_ARGUMENT name value**

Adds an abbreviation that is expanded only when it occurs in the argument position of a command line

## **-ADD\_COMMAND name value**

Adds an abbreviation that is expanded only when it occurs in the command position of a command line

## **-CHANGE name 1 [ name-n ]**

Changes the specified abbreviations to be expandable anywhere on the command line

## **-CHANGE\_ARGUMENT name-1 [ name-n ]**

Changes the specified abbreviations to be expandable only in the argument position of the command line

## **-CHANGE\_COMMAND name-1 [ name-n ]**

Changes the specified abbreviations to be expandable only in the command position of the command line

## **-CHANGE\_NAME old-name new-name**

Changes the name of the abbreviation **old-name** to **new-name**

## **-DELETE name-1 [ name-n ]**

Deletes the specified abbreviations from the abbreviation file

## **-NO\_QUERY**

Replaces the old abbreviation without asking (Only useful if followed by one of the -ADD options)

## ➤ **ADD\_REMOTE\_ID user-id [ password ]**

**-O\ nodename [ -PROJECT project-id ]**

Specifies the id for a remote system slave. Arguments and options are the same as for the LOGIN command

## ➤ **ASRCWD [ number ]**

Used only with serial I/O, ASRCWD 0 recovers a diverted terminal line from a serial printer, card reader or punch

► **ASSIGN** { **device** [ -WAIT ]  
**DISK pdisk** [ -WAIT ]  
**AMLC** [ **protocol** ] **amlc-line** [ **config** ] }

Gives user exclusive use of disk, line, or peripheral device

<i>Device Code</i>	<i>Meaning</i>
<b>CARDR</b>	Serial Card Reader
<b>CENPR, CE2PR</b>	Serial Printer
<b>CRn</b> ( $0 \leq n \leq 1$ )	MPC Parallel Card Reader or Reader/Punch
<b>DISK pdisk</b>	Physical Disk Partition ( <b>pdisk</b> is a physical disk number in octal)
<b>GS0-GS3</b>	Vector General graphics display terminal
<b>MG0-MG3</b>	Megatek graphics display terminal
<b>MTn</b> ( $0 \leq n \leq 7$ )	Magnetic Tape Unit
<b>PRn</b> ( $0 \leq n \leq 3$ )	Line Printer
<b>PTR</b>	Paper Tape Reader
<b>PUNCH</b>	Paper Tape Punch
<b>PLOT</b>	Printer/Plotter
<b>SMLCnn</b>	Synchronous Communications Line ( $00 \leq nn \leq 07$ )

<i>Protocol</i>	<i>Meaning</i>
<b>TTY</b>	Normal terminal
<b>TTYHS</b>	TTY with per-character interrupt
<b>TRAN</b>	Transparent (no-character conversion)
<b>TRANHS</b>	TRAN with per-character interrupt
<b>TTYUPC</b>	Translates lowercase to uppercase for output
<b>TTYHUP</b>	High-speed TTYUPC

<i>Config</i>	<i>Meaning</i>
<b>2033</b>	110 Baud
<b>2213</b>	300 Baud
<b>2313</b>	1200 Baud (Default)
<b>2413</b>	Programmable clock (Default is 9600 )

For a complete description of the arguments **protocol** and **config**, see the AMLC command in the **System Administrator's Guide**.

For magnetic tape drives, the format is:

```
ASSIGN { MTpdn [ -ALIAS MTldn ] } [ options ]
        { MTX -ALIAS MTldn }
```

For interactive work, give the ASSIGN MTpdn command and either mount your own tapes or ask the operator to mount them. ASSIGN options are

<i>Option</i>	<i>Description</i>
<b>MTpdn</b>	Magnetic tape (MT) unit number, from 0 to 7, inclusive <b>pdn</b> is the physical device number assigned to each drive at system start-up
<b>MTldn</b>	The logical drive number, from 0 to 7, inclusive <b>ldn</b> is a user-specified number assigned to a particular physical drive unit, mapped into <b>pdn</b> in subsequent magnetic tape operations
<b>MTX</b>	Tells the operator to assign "any available drive" Must be accompanied by the -ALIAS MTldn option The actual drive assigned depends on any other options that appear on the command line Always requires operator intervention

Option	Description
<b>-WAIT</b>	Indicates you are willing to wait until the requested drive is available
<b>-TPID id</b>	Asks the operator to mount the tape <b>id</b> . Requires operator intervention. <b>id</b> is a list of tape identifiers (arguments) describing a particular reel of tape and/or type of tape drive (name number etc ). Identifiers must not contain the following delimiters: commas, spaces, NL, and /*. They cannot begin with a hyphen or dash (-) which is reserved to indicate the next control argument on the ASSIGN statement line.
<b>-MOUNT</b>	Asks the operator to mount a new tape reel. The tape drive must already be assigned.
<b>-RETENSION</b>	Causes the mounted tape cartridge to be retensioned. Used with cartridge tape drives only.
<b>-RINGON</b>	Asks the operator to put a write ring on the tape, allows reading and writing of the tape.
<b>-RINGOFF</b>	Asks the operator to remove the write ring from the tape, protects the tape against writing but allows reading.
<b>-DENSITY bpi</b>	Selects tape density settings in bytes per inch. Requires operator intervention on Version 0, 1, and 2 drives. <b>bpi</b> must be one of the following: <div> <div>800</div> <div>1600</div> <div>3200</div> <div>6250</div> </div>

<i>Option</i>	<i>Description</i>
<b>-SPEED ips</b>	Allows the user to set the tape speed at 25 ips or 100 ips when the density is 1600 bpi. Used only with streamer tape.
<b>{-7TRK}</b> <b>{-9TRK}</b>	Specifies 7- or 9-track tape. Requires operator intervention. The default is 9-track tape.

### ► ATM

Starts up the Advanced Text Management module of the Office Automation System (OAS)

### ► ATM ADMIN

Allows the Office Automation System (OAS) Administrator to create and maintain the document data base and files for Document Database Indexing

### ✓ TTACH **pathname**

Changes your current directory to **pathname**.

Examples of pathnames

<DISK>MYUFD>MYSUBDIRECTORY

<DISK>MYUFD

<\*>MYUFD

MYUFD>MYSUBDIRECTORY

MYUFD

<5>YOURUFD>SUBDIR

\*>SUBDIR

<\*> means 'on current disk' but \*> means "under home (current) directory"

To attach to an ACL directory, you must have use (U) access to all directories in the pathname. To attach to a password directory, give the appropriate password after the directory name. If you do not specify a disk name or \*> as part of the pathname, PRIMOS searches all disks to which you have access.

► AVAIL  $\left[ \begin{array}{c} \text{packname} \\ -\text{LDEV } n \\ * \end{array} \right] \quad [ -\text{NORM} ]$

With no argument, gives disk usage statistics for the current disk. With **packname**, or with disk number (-LDEV **n**), gives statistics for the specified disk. With \* gives the status of all disks in the file SYSTEM>DISCS. Measurements are in 2048-byte physical records unless you specify the -NORM option, which gives measurements in 880 byte “normalized” records.

► BASIC [ **pathname** ]

Runs the Prime BASIC Language interpreter. See the **Interpretive BASIC Programmer's Guide**.

► BASICV [ **pathname** ]

Activates BASIC/VM, Prime's virtual-memory BASIC subsystem. Executes the optional **pathname** as a BASIC program. See the **BASIC/VM Programmer's Guide**.

► BASINP **pathname**

Loads a non-Prime BASIC program from paper tape into **pathname**.

► BATCH  $\left\{ \begin{array}{l} -\text{DISPLAY} \\ -\text{STATUS} \end{array} \right\}$

Displays information on jobs being processed by the Batch subsystem.

BATCH -DISPLAY tells how many jobs are waiting in each Batch queue, and the user-name, job-id, user number, and queue for each job currently executing.

BATCH -STATUS displays one line that gives the number of waiting and held jobs, the number of queues with waiting and held jobs, and the number of executing jobs.

See also BATGEN, JOB

► **BATGEN** { **-FIS LAY** [ **queue name** ] }  
                   { **-S ATUS** }

**BATGEN -DISPLAY** displays name, status, and characteristics for each Batch queue. If **queue name** is given, information for that queue only is displayed.

**BATGEN -STATUS** displays queue status, either **BLOCKED** or **UNBLOCKED**. An unblocked queue accepts jobs; a blocked queue does not.

### **INARY pathname**

Opens **pathname** for writing on file unit 3 for output. Equivalent to **OPEN pathname 3 2**.

**BINARY** is useful for sending the output of several compilations to a single file.

► **CHANGE\_ ASS ORD** [ **old-password** ]

Allows you to create or change your login password. To create a password for the first time, type **CHANGE\_PASSWORD**. To change an existing password, enter **old-password** on the command line. The system prompts twice for the new password. Your new password is not echoed unless the terminal is in half-duplex mode.

► **CHA** { }

Changes your execution priority level within the range assigned by the operator. Higher priority levels are more favored. Use **CHAP UP** to raise your priority by one. Use **CHAP DOWN** to lower your priority by one.

**LOSE** { **pathname**  
                   **unit-1** [ **unit-8** ] }

Closes up to eight specified files and file units. **units** are decimal file unit numbers specifying any legal file unit except decimal 127, the comoutput file unit. **CLOSE pathname** closes the named file. **CLOSE -ALL** closes all of your open files.

► **CMPF file-a file-b [ file-c file-e ] [ options ]**

Compares lines in up to five ASCII files, showing insertions, changes, and deletions from **file-a**. Files can be specified by pathname

Option	Meaning
<b>-BRIEF</b>	Suppresses the display of differing lines
<b>-MINL number</b>	Sets the minimum <b>number</b> of lines that must match (Default is 3 )
<b>-REPORT pathname</b>	Sends the output to <b>pathname</b> Suppresses terminal output

► **CNAME oldname newname**

Changes the name of the file (or directory) from **oldname** to **newname**. **oldname** can be specified by **pathname**; **newname** cannot When a pathname has been used for **oldname**, **newname** replaces only the final element of the pathname CNAME requires delete (D) and add (A) rights for ACL directories, and owner status for password directories

► **COBOL pathname [ options ]**

Runs the COBOL compiler For information see the **COBOL Reference Guide**

► **COMINPUT [ pathname ] [ funit ]**

[	<b>-CONTINUE</b>	]
	<b>-END</b>	
	<b>-PAUSE</b>	
	<b>-START</b>	
	<b>-TTY</b>	

Reads the command input from **pathname** instead of the terminal Input file unit is 6 (default) unless **funit** is specified **funit** must be octal

Option	Meaning
<b>-CONTINUE</b>	Continues reading commands from the suspended command file open on <b>funit</b> .
<b>-END</b>	Returns to the terminal for input, closes command input unit
<b>-PAUSE</b>	Returns to the terminal for input, suspending the current command file (does not close <b>funit</b> )
<b>-START</b>	Restarts after CONTROL-P or a subsystem error
<b>-TTY</b>	Same as <b>-END</b>

### Notes

- 1 CLOSE **-ALL** closes the COMINPUT file unit, causing the error message 'End of file Cominput (Input from terminal)''
- 2 To insert comments in the file begin each comment line with /\*

### ► COMOUTPUT [ **pathname** ] [ **options** ]

Sends the output stream to the file named by **pathname** or the file opened on the command output unit. If you specify **pathname** but no options, and the file named already exists, the previous contents of that file are instantly overwritten. Not closed by CLOSE **-ALL**.

Option	Meaning
<b>-CONTINUE</b>	Appends output to existing file. When unit is open (following COMOUTPUT <b>-PAUSE</b> ) no <b>pathname</b> is needed. When unit is not open, <b>pathname</b> must precede <b>-CONTINUE</b> .

Option	Meaning
<b>-END</b>	The recommended way to close a COMOUTPUT file, equivalent to CLOSE filename
<b>-NTTY</b>	Turns off terminal output including the OK prompt
<b>-PAUSE</b>	Stops output but does not close the output file
<b>-TTY</b>	Turns on terminal output after COMOUTPUT -NTTY is used

### ► **CONCAT [ pathname ] [ options ]**

Combines a number of input files into an output file suitable for spooling

Command line options are as follows **outfile** (if specified) must be the first option, **-BANNER** (if specified) must be the last Other options may be given in any order

To specify the output file

#### **outfile**

A filename or pathname of the output file If **outfile** is omitted the file open on the output unit is used instead (The default output unit is unit 2 but this can be changed with the **-OUNIT** option ) If no file is open **CONCAT** returns an error message Output file not open (**CONCAT**)

To specify file units

#### **-i IT n**

Specifies the unit on which the input files will be opened (Default unit is 1 )

#### **-o OT n**

Specifies the unit on which the output file will be opened (Default unit is 2 ) If **outfile** is omitted from the command line the file open on unit **n** is used for output

To specify output file disposition

**-CLOSE**

Truncates and closes **outfile** on exit (Default)

**-OPEN**

On exit leaves **outfile** open but does not truncate it

**-TRUNCATE**

On exit truncates **outfile** but leaves it open

To specify output file verification

**-VERIFY**

For the existing outfile the system asks 'OK TO MODIFY OLD outfile?' then asks OVERWRITE OR APPEND (Default mode)

**-OVERWRITE**

Overwrites the existing outfile

**-APPEND**

Appends output to the existing outfile

To specify mode

**-INSERT**

Goes directly into insert mode (prompt is " ") and accepts a list of files to be inserted into the output file. If neither -INSERT nor -COMMAND is given on the command line -INSERT is assumed. Use an empty line (carriage return only) to return from insert mode to command mode.

**-COMMAND**

Enters command mode (prompt is > ) See the section below for a description of command mode

## COMMANDS USED AS OPTIONS OR AS SUBCOMMANDS

The following instructions can be given either as options on the command line (preceded by a hyphen), or as subcommands when CONCAT is in command mode. (For example, -HEADER is a command line option, while HEADER is a subcommand.)

## Note

When CONCAT is in command mode, it ignores blank lines and text preceded by /\*.

To specify formatting:

### **BANNER [ banner-line ]**

Generates both banners (headers) and titles. **banner-line** is the first line of the banner. If omitted, that line is left blank.

### **EJECT**

Generates a page eject between files. Suppresses both titles and header pages.

### **HEADER**

Generates titles but suppresses header pages.

### **NHEADER**

Suppresses both titles and header pages. Files are copied without change.

### **NRESETP**

Does not reset page numbering. (Default)

### **RESETP**

Resets spooler page numbering between input files.

To specify input file disposition:

### **DELETE**

Deletes the input file after copying it to the output file. This option has no abbreviation.

### **NDELETE**

Does not delete the input file after copying it to the output file. (Default)

CONCAT recognizes three further subcommands:

### **TITLE [ new-title ]**

Use **new-title** as the header for the next input file. It is read as raw text so that spaces are accepted. If **new-title** is omitted, the filename is used.

## INSERT [ **file-name-list** ]

If **file-name-list** is omitted, CONCAT enters insert mode and accepts the names of concatenated files, one per line. To exit from insert mode, enter a blank or null line. If **file-name-list** is specified, CONCAT concatenates the files in the list into the output file without entering insert mode. Up to forty files can be specified on one line, separated by spaces or commas. If an error is made in the line, INSERT ignores the rest of the line. Pathnames with imbedded spaces (i.e., passwords) must be enclosed in quotes.

## QUIT

Exits from CONCAT. This is the only clean way to exit from CONCAT.

## ► **COPY pathname [ new-pathname ] [ options. ]**

Copies files, directories, segment directories, and access categories within a directory or from one directory to another. COPY does not allow you to copy or overwrite the MFD, BOOT, or DSKRAT files of an MFD. **pathname** names the object you want to copy (source object). **new-pathname** names the new copy of the object (target object). If you omit **new-pathname**, the source object is copied into your current directory under its original name. You must have add (A) access to the directory in **new-pathname**, and delete (D) access to it if the object in **new-pathname** already exists.

<i>Option</i>	<i>Meaning</i>
<b>-COPY_ALL</b>	Preserves all attributes of a copied object including protection
<b>-DAM</b>	Converts all copied SAM files to DAM files
<b>-DELETE</b>	Deletes the source object after copying. (Default is no deletion.)
<b>-DTM</b>	Preserves the date/time modified stamp of all copied objects

<i>Option</i>	<i>Meaning</i>
<b>-FORCE</b>	Force-deletes delete protected objects
<b>-INCREMENTAL</b>	Copies only those objects whose dumped bit is off (= 0)
<b>-LEVELS [ dec ]</b>	Copies down to the level indicated by <b>dec</b> (a decimal integer from 0 to 999)
<b>-NO_QUERY</b>	Asks PRIMOS to resolve any unexpected copy situations
<b>-PROTECT</b>	Preserves the protection attributes of all copied objects. If <b>-PROTECT</b> is omitted, copied objects are protected by the default ACLs in the target directory.
<b>-QUERY</b>	Asks you to resolve any unexpected situations during a COPY procedure (Default)
<b>-QUOTA</b>	Preserves maximum quota information for a copied directory and its subdirectories
<b>-REPLACE</b>	Copies only the objects that are already in both the source and target directories
<b>-REPORT</b>	Reports the results of each successful copy operation
<b>-RWLOCK</b>	Preserves the concurrency lock setting of the copied object
<b>-SAM</b>	Converts all DAM files to SAM files

#### ► **CPI pathname**

Activates the CPL interpreter and executes the CPL program named by **pathname**.

► **CPMPC** **pathname** [ **n** ] [ **-PRINT** ]

Punches the file **pathname** on cards in assigned card reader/punch Does not punch a \$E end of-file card

Option	Meaning
<b>-CRn</b>	Card reader/punch <b>n</b> (0 or 1)
<b>-PRINT</b>	Prints punched data on the card (if the punch can do so)

► **CREATE** **pathname** [ **options** ]

Creates a new directory as specified by **pathname**

- **EGORY category-name**  
Protects the new directory with the named access category Cannot be used on a password directory
- **MA quota**  
Sets the specified quota on the new directory
- **ASS ORD**  
Creates new directory as a password directory Otherwise, the new directory is the same type as its parent

► **CRMPC** **pathname** [ **n** ] [ **-PRINT** ]

Reads cards from parallel interface card reader 0 or 1 into **pathname** Cards are translated into ASCII Reading continues until one of the following happens

- \$E is read in columns 1 and 2 (recommended)
- Reader runs out of cards
- STOP button on reader is pressed
- BREAK or CTRL P is pressed on terminal

Option	Meaning
<b>-CR n</b>	Card reader <b>n</b> (0 or 1)
<b>-PRINT</b>	Prints card contents on the card (if the card reader can do so)

► **DELAY** [ **min** ] [ **max** ] [ **margin** ]

Sets terminal delay characteristics. All numbers are in octal. Can be set prior to logging in. Defaults for 30 CPS terminals: **min** is 6, **max** is 12 (14 octal), **margin** is 72 (110 octal). Values must be specified in octal. DELAY 0 0 1 turns off delay padding.

► **DELFILE** **pathname** [ **options** ]

Deletes objects: files, directories, segment directories, and access categories.

Note

The MFD BOOT or DSKRAT files in an MFD cannot be deleted with this command.

Option	Meaning
<b>-FORCE</b>	Force deletes all delete protected objects you select.
<b>-NO_QUERY</b>	Asks PRIMOS to resolve any unexpected situations during a DELETE procedure.
<b>-QUERY</b>	Asks you to resolve any unexpected situations during a DELETE procedure (Default).
<b>-REPORT</b>	Reports the results of each successful deletion.

When **pathname** includes wildcards, you can specify **-NO\_VERIFY** so that PRIMOS queries only for the deletion of subdirectories and access categories. If you specify both **-NO\_QUERY** and **-NO\_VERIFY**, PRIMOS does not query about any deletions.

► **DELETE\_VAR** **variable-names**

Deletes the named variables from an active global variable file. **variable-names** can be wildcard names.

► **DELSEG** { **segno-1** [ **-TO** **segno-2** ] }  
 { **ALL** }

Deletes a segment The **-TO** option deletes all segments in a range of numbers **segno** must be specified in octal **ALL** releases all segments belonging to you

► **DMSTK** [ **options** ]

Produces a call/return trace of your command loop stack and static mode stack (if any) Addresses are always printed in octal

<i>Option</i>	<i>Meaning</i>
<b>-BRIEF</b>	Specifies a short format dump, omitting condition frames and fault frames (Default is full format )
<b>-ALL</b>	Begins the dump with the frame from which DMSTK was called If <b>-ALL</b> is not specified dumping begins with the most recent condition frame (if there is one) or with the frame from which DMSTK was called
<b>-FROM n</b>	Begins the dump with frame <b>n</b> (DMSTK is called from frame 1 ) If <b>-FROM</b> is not given the <b>-ALL</b> option determines the starting point for the dump
<b>-FRAMES n</b>	Specifies that only <b>n</b> frames of the stack are to be dumped <b>n</b> must be a positive decimal integer (Default dumps the entire stack )
<b>-ON_UNITS</b>	Produces a list of on-units established by each frame that is dumped

## ► DROPDTR

Forces the dropping of the DTR (Data Terminal Ready) signal associated with an AMLC line. DROPDTR is useful only with a user line connected into a port selector or modem. After logging out, give the DROPDTR command to force a disconnect. You can then reconnect to another port without waiting the normal amount of grace time set by the System Administrator.

## ► ED [ **pathname** ]

Uses the line-oriented text editor to create a new file or edit the existing file named by **pathname**. A carriage return inputs one line at a time from the terminal. For more information, see the **New User's Guide to EDITOR and RUNOFF**.

<i>Default</i>	<i>Character</i>
Erase character	(or user's selected Erase)
Kill character	? (or user's selected Kill)
Tab character	\
Wild character	!
Default tab settings	6 12 30 81
Command/input line terminators	(or carriage return)
Escape character to remove special meaning from next character	

## EDITOR SUBCOMMANDS

### APPEND **string**

Attaches **string** to the end of the current line.

### BOTTOM

Moves the pointer to the bottom of the work file.

### BRIEF

Suppresses verification output of APPEND, CHANGE, FIND, GMODIFY, LOCATE, MODIFY, NEXT, and FIND. Speeds up the editing process. Opposite of VERIFY; use VERIFY to return to verification mode.

**CHANGE/string-1/string-2/[ G ][ n ]**

Replaces **string-1** with **string-2** on **n** lines once, or globally [G] The '/' may be any character not appearing in **string-1** or **string-2**

**DELETE [ n ]**

Deletes **n** lines, or the current line when no **n** is given

**DELETE TO string**

Deletes lines from the file until **string** is found

**DUNLOAD filename [ n ]**

Copies and deletes **n** lines and puts them in **filename**.  
(Default of **n** = 1 )

**DUNLOAD filename TO string**

Copies and deletes lines until **string** is found

**ERASE character**

Makes **character** the new erase character for the current editing session

**FILE [ filename ]**

Files the work file under **filename** or the current filename

**FIND string**

Finds the first line below the current line containing **string** in column 1

**FIND ( n ) string**

Finds the first line below the current line containing **string** in column **n**

**FN**

Displays the current filename

**GMODIFY**

Alters the current line on a character-by-character or column-by-column basis See the **New User's Guide to EDITOR and RUNOFF**, Chapter 8

**Subcommands****Meaning****A/string/**

Copies current line and appends **string**

**Bn**

Moves pointer back **n** spaces

**Cc**

Copies up to but not including character **c**.

**Dc**

Skips up to but not including character **c**

**En**

Skips next **n** characters

**F**

Copies to end of line

Subcommands	Meaning
<b>I/string/</b>	Inserts <b>string</b> starting at current column
<b>Mn</b>	Copies <b>n</b> characters
<b>N</b>	Tests for "not character" in next C or D command
<b>O/string/</b>	Overlays <b>string</b> starting at current column
<b>R/string/</b>	Retypes, using <b>string</b> , from current column
<b>S</b>	Moves pointer to column 1
<b>IB string</b>	
Inserts <b>string</b> as a new line immediately before the current line	
<b>INPUT [ device ] ( rarely used )</b>	
Reads from either (ASR), (PTR), or (TTY) (the default) device	
<b>INSERT newline</b>	
Inserts <b>newline</b> below the current line Causes EDITOR to change from EDIT to INPUT mode	
<b>KILL character</b>	
Makes <b>character</b> the kill character for the current editing session	
<b>LINESZ [ n ]</b>	
Makes <b>n</b> the maximum line length (Minimum <b>n</b> is 10 )	
<b>LOAD filename</b>	
Copies <b>filename</b> into the work file just below the current line	
<b>LOCATE string</b>	
Finds the first line below the current line containing <b>string</b> Searches for the first occurrence of <b>string</b> below the current line	
<b>MODE CKPAR</b>	
Checks the parity bit, if 0, prints characters as octal numbers	
<b>MODE NCKPAR</b>	
Displays characters normally, regardless of the parity bit (Default)	
<b>MODE COLUMN</b>	
Displays a header showing the column position at the beginning of INPUT mode	

## **MODE NCOLUMN**

Does not print a column position header (Default)

## **MODE COUNT [ start ][ incr ][ wi ][ options ]**

Increments a counter symbol after each use and replaces it in the text by the current value. Used with the following commands: APPEND, INSERT, OVERLAY, RETYPE, or GMODIFY

<b>start</b>	Initial value >0 (Default is 1 )
<b>incr</b>	Initial increment $\neq$ zero (Default is 1 )
<b>wi</b>	Field width (number of digits) Must be from 1 to 10 (Default is 5 )
<b>PRINT</b>	Prints leading zeros (Default)
<b>BLANK</b>	Replaces leading zeros with blanks
<b>SUPPRESS</b>	Suppresses leading zeros

## **MODE NCOUNT**

Deactivates the counter (Default)

## **MODE INFO**

Treats all carriage returns in command mode as NEXT commands (To enter INPUT mode, type the INPUT command )

## **MODE NOINFO**

Returns to ordinary operating mode (Default)

## **MODE NUMBER**

Displays line numbers in the first five columns

## **MODE NNUMBER**

Does not display line numbers (Default)

## **MODE PROMPT**

Displays prompts for INPUT and EDIT modes

## **MODE NPROMPT**

Does not display prompts for INPUT and EDIT modes (Default)

## **MODE PRALL**

Handles upper- and lowercase characters normally (Default)

## **MODE PRUPPER**

Flags uppercase letters with ^ U (up-arrow-U) and lowercase letters with ^ L (up-arrow-L) The default assumes that all lines begin with uppercase

## MODE PRLOWER

Flags uppercase letters with ^ U (up-arrow U) and lowercase letters with ^ L (up-arrow-L) The default assumes that all lines begin with lowercase

## MODE SEMI

Treats a semicolon as a line separator even in INPUT mode (Default)

## MODE NOSEMI

Treats a semicolon as an ordinary character in INSERT, APPEND, OVERLAY, and INPUT modes Treats a semicolon as a command separator in EDIT mode

## MODIFY/old/new/[ *G* ] [ *n* ]

Changes **old** to **new** without changing column alignment *G* changes every occurrence on a line *n* changes every occurrence in *n* lines

## MOVE *buffer-1* { *buffer-2* }                               /*string*/ }

Moves **string** or contents of **buffer-2** into **buffer-1** Buffer names are EDLIN, INLIN, and STR 1 through STR 10 Does not change the current line pointer

## NEXT [ *n* ]

Moves the pointer *n* lines and displays the new current line A positive *n* moves down the file A negative *n* moves up the file An unspecified *n* defaults to 1

## NFIND *string*

Finds the first line that does not begin with **string** in column 1

## NFIND( *n* ) *string*

Finds the first line that does not begin with **string** in column *n*

## NLOCATE *string*

Finds the first line that does not contain **string** anywhere in the line

## OOPS

Undoes the last modification to a line, provided you are at the line last modified

## OUTPUT { (DISPLAY) }                               (TTY) }

Sends verification output to a specified device (Default is TTY) Rarely used

## OVERLAY *string*

Superimposes **string** on the current line

## **PAUSE**

Freezes the EDIT session, goes to PRIMOS-level  
(Return with START)

## **POINT n**

Moves the pointer to line **n**

## **PP [ m ][ n ]**

Prints from five lines before to five lines after the current line. Specifying **m** and **n**, PP -8 12 (for example) would print from 8 lines before to 12 lines after the current line

## **PRINT [ n ]**

Prints the current line, or the next **n** lines, including the current line

## **PSYMBOL**

Displays the current values of the symbols (such as your erase and kill characters) that can be set by the ERASE, KILL, and SYMBOL commands

## **PTABSET ptab-1 ptab 2...**

This rarely-used command sets physical tab stops on your terminal

## **PUNCH { (ASR) } [ n ]** **{ (PTP) }**

Punches **n** lines of the indicated device. Rarely used

**ASR**                      Teletypewriter punch

**PTP**                      High-speed punch

## **QUIT**

Leaves the EDITOR without saving the results of a session

## **QF**

Quits to PRIMOS without question, even if the work file is modified

## **RETYPE string**

Deletes the current line replacing it with **string**

## **SAVE [ filename ]**

Saves the file without leaving the EDITOR. It is good practice to use SAVE frequently

## **SYMBOL name character**

Changes the character value of a special symbol. For example, SYMBOL TAB + changes the tab symbol from \ to +

<i>Special Symbol Name</i>	<i>Character</i>
<b>KILL</b>	?
<b>ERASE</b>	”
<b>WILD</b>	!
<b>BLANKS</b>	#
<b>TAB</b>	\
<b>ESCAPE</b>	^
<b>CPROMPT</b>	\$
<b>DPROMPT</b>	&
<b>SEMICOLON</b>	,
<b>COUNTER</b>	@

### **TABSET tab-1 tab-2... tab-8**

Sets these logical tab stops for EDITOR's tab symbol  
Default is 6 12 30, 81

### **TOP**

Moves the pointer to the top of the file (null line)

### **UNLOAD filename [ n ]**

Copies **n** lines (starting with the current line) from the work file into **filename**. If **n** is omitted, one line is copied. If **filename** already exists, its contents are replaced with the copied lines.

### **UNLOAD filename TO string**

Copies text into **filename** from the current line until **string** is found. If **string** is not found, copies everything down to the bottom of the file.

### **VERIFY**

Turns on verification output, opposite of BRIEF (Default)

### **WHERE**

Prints the current line number

### **XEQ [ buffer ]**

Executes the contents of the buffer as a command line. If a buffer is not specified, XEQ executes the previous command.

### **\*[ n ]**

Repeats the preceding commands on the line either **n** times or until TOP or BOTTOM is reached.

## ► EDB inputfile [ outputfile ]

Starts the binary editor, used for building and maintaining libraries of subroutines. The input and output files can be on disk or paper tape. If the pathname **outputfile** already exists, the output file overwrites it. If **inputfile** or **outputfile** is on paper tape, use the name **-PTR**. For example **EDB -PTR NEWLIB**

## EDB SUBCOMMANDS

### BRIEF

Suppresses the display of subroutine names and entry points

### COPY { name } ALL }

Copies main programs and subroutines from the EDB pointer until it finds **name**. The EDB pointer remains at the beginning of **name**. If **name** is not found or if **COPY ALL** is given, EDB copies to the end of the input file and displays **BOTTOM** on the terminal.

### FIND { name } ALL }

Moves the pointer to the subroutine **name** or the end of the infile. In **VERIFY** mode, displays subroutine and entry names.

### INSERT pathname

Copies **pathname** to the outfile (pointer unchanged)

### NEWINF pathname

Closes the infile, opens **pathname** as the new input file

### OPEN pathname

Closes the outfile, opens **pathname** as the new output file

### QUIT

Closes all files, returns to PRIMOS

### REPLACE name pathname

Replaces the subroutine containing **name** by **pathname**

### RFL

Writes a reset force load flag block to the output file. Places a loader in library mode; only referenced modules are loaded. **RFL** mode is in effect until the loader encounters an **SFL** block.

## SFL

Writes a set-force-load flag block to the output file. Places a loader in force-load mode; all subsequent modules are loaded, whether or not they are called. SFL mode is in effect until the loader encounters an RFL block. It is good practice to end a library file with an SFL block.

## TERSE

Enters terse mode (displays first entry point only).

## TOP

Moves the pointer to the top of the file.

## VERIFY

Enters VERIFY mode. (Default) Displays all subroutine names and entry points.

## ► EDIT\_ACCESS target acl [ -NO\_QUERY ]

Modifies existing access control lists (ACLs) for **target** to correspond to the access given in **acl**. **acl** lists access rights for an individual or a group. The format for **acl** is:

**identifier : rights [ ...identifier : rights ]**

**identifier** is either a user id, an ACL group name, or the string \$REST. **rights** may be: NONE (no rights); ALL (all rights); or any combination of P (protect), D (delete), A (add), L (list), U (use), R (read), and W (write). If access for any identifier is null (that is, **identifier:**), the id is removed from the list. **target** can be an ACL-protected file or an access category. If you specify -NO\_QUERY, all actions are carried out without question.

Do not use EDIT\_ACCESS on files that have default protection or are category-protected. Use SET\_ACCESS instead.

► **EDIT\_PROFILE [ pathname ] -PROJECT project-id**

Allows System and Project Administrators to add, change, and delete information about users, projects, and their respective attributes. To enter Project Administrator mode, use the **-PROJECT** option and specify a project id. The project you specify becomes your current project. All commands are performed on that project unless you specify an optional **project-id** in an **EDIT\_PROFILE** subcommand. Specify **pathname** only when the project is not on your local system.

This companion gives Project Administrator subcommands only. For System Administrator subcommands, refer to the **System Administrator's Guide**.

## EDIT\_PROFILE SUBCOMMANDS

**HELP [ command-name ]**

Displays arguments, options, and option arguments for one or all **EDIT\_PROFILE** subcommands. All subcommands are shown unless you specify **command-name**.

**ATTACH\_PROJECT [ project-id ]**

Names the new current project for this **EDIT\_PROFILE** session. If you do not specify **project-id**, **EDIT\_PROFILE** prompts for it.

**ADD\_USER [ user-id ] [ options ]**

Adds a new member to your project and creates the user's profile. Options are as follows:

<i>Option</i>	<i>Meaning</i>
<b>user-id</b>	Used alone, adds that user to the project as a new member with default attributes of the project profile.
<b>-LIKE reference</b>	Gives the new user the same attributes as user <b>reference</b> .
<b>-NO_QUERY</b>	Prevents <b>EDIT_PROFILE</b> from asking whether you want to check or change the newly created user profile.

<i>Option</i>	<i>Description</i>
<b>-PROFILE</b>	Instructs EDIT_PROFILE to prompt for the profile of the new user. Default is the project profile.
<b>-PROJECT</b> <b>[ project-id ]</b>	Names the project to which the user is added (needed only if you administer several projects).

**CHANGE\_PROJECT [ project-id ] [ -PROFILE ] [ -LIST ]**  
 Changes the project profile. -PROFILE causes EDIT\_PROFILE to prompt for changes to the project profile. -LIST displays the latest version of project attributes.

**CHANGE\_USER [ user-id ] [ -PROJECT project-id ] [ -LIST ]**

Changes a user's project-based attributes. **user-id** identifies the project member whose attributes you wish to change. If you do not give **user-id**, the system prompts you to enter it. The -LIST option displays the latest version of the user's attributes.

**DELETE\_USER [ user-id ] [ -PROJECT project-id ]**  
 Deletes a user from your project.

**DETACH\_PROJECT [ project-id ]**

Clears the setting of a current project set by a previous ATTACH\_PROJECT command.

**LIST\_PROJECT [ project-id ] [ options ]**

Displays project and user attributes. Always includes project limits set by the System Administrator.

<i>Option</i>	<i>Meaning</i>
<b>-ALL</b>	Lists profiles for all project members.
<b>-OUTPUT</b> <b>pathname</b>	Directs output into the file specified by <b>pathname</b> .
<b>-APPEND</b>	Used with -OUTPUT to append to a file, rather than overwrite it.
<b>-PROFILE</b>	Displays the project attributes.
<b>-TTY</b>	Displays output at the terminal. May be used with -OUTPUT (Default).
<b>-USER user-id</b>	Lists the profile of the specified project member.

**LIST\_USER [ user-id ] [ -PROJECT project-id ] [ -ALL ]**  
Lists a user's attributes. The **-ALL** option displays the user's attributes in each project that you administer.

**REBUILD [ -PROJECT project-id ] [ -SIZE entry-count ]**  
Rebuilds your project to hold more members. Specify **-SIZE** to reserve space for **entry-count** users. Project members cannot log in to your project while **EDIT\_PROFILE** rebuilds it.

## **QUIT**

Leaves **EDIT\_PROFILE** and returns to PRIMOS command level.

## ► **EMACS**

Activates the EMACS character-oriented screen editor. For more information, see the **EMACS Primer**, the **EMACS Reference Guide**, and the **EMACS Extension Writing Guide**.

## ► **F77 pathname [ options ]**

Runs the FORTRAN 77 compiler. For information, see the **FORTRAN 77 Reference Guide**.

## ► **FILMEM [ ALL ]**

Clears the contents of user address space to zeros for unsegmented (R-mode) programs.

- Under PRIMOS, **FILMEM** clears locations '100 through '77777. **FILMEM ALL** clears 100 through '177777.
- Under PRIMOS II, **FILMEM** clears locations '100 through '47777, except for those occupied by PRIMOS II itself. **FILMEM ALL** clears all user space except for that occupied by PRIMOS II.

## ► **FILVER [ pathname-1 ] [ pathname-2 ]**

Compares two files. Prints out the differences in octal, in the format

**DIFF w x y z**

where

- w** is sector number, in octal  
(1000 octal words per sector)
- x** is offset in words, in octal
- y** is first file value, in octal
- z** is second file value, in octal

► **FTN** *pathname* [ **options** ]

Runs the FORTRAN compiler For more information see the **FORTRAN Reference Guide**

► **FTR**

The File Transfer Request utility (FTR) allows you to request and manage file transfers between Prime computers connected by PRIMENET FTR is part of the File Transfer Service (FTS) a separately priced product

To request a file transfer use the following format

**FTR** *source-file* [ *destination-file* ] [ **options** ]

**source-file** is the pathname of the file to be transferred **destination-file**, also a pathname is the name of the transferred file Do not give a **destination-file** if you use the **-DEVICE** option

<i>Option</i>	<i>Meaning</i>
<b>-DSTN_SITE</b> <i>sitename</i>	Names the destination site You must specify this option when you send a file to a remote site
<b>-DSTN_USER</b> <i>username</i>	Names the owner of the file at the destination site
<b>-DEVICE</b> <i>LP</i>	Allows direct file transfer to a line printer at a remote site
<b>-HOLD</b>	Holds the request until a user or operator releases it
<b>-LOG</b> <i>pathname</i>	Creates a log file recording progress of this request
<b>-NAME</b> <i>external-name</i>	Specifies the external name of the request (Default is source file )
<b>-SRC_SITE</b> <i>sitename</i>	Specifies the source site (Default is your local site ) You must use this option to transfer a file from a remote site
<b>-SRC USER</b> <i>username</i>	Names the owner of the file at the source site

To manage requests after they have been submitted, use the following format:

**FTR [ option ]**

Option	Meaning
<b>-ABORT requestname</b>	Aborts a file transfer request.
<b>-CANCEL requestname</b>	Cancels a file transfer request.
<b>-DISPLAY [ requestname ]</b>	Displays the contents of one or more requests.
<b>-HOLD requestname</b>	Delays a file transfer until a user or operator releases the request by using the <b>-RELEASE</b> option.
<b>-MODIFY requestname [ options ]</b>	Modifies the characteristics of the specified request. <b>options</b> are the same as the submittal options.
<b>-RELEASE requestname</b>	Releases a held request.
<b>-STATUS [ requestname ]</b>	Displays the status of one or more requests.

► **HDXSTAT**

Displays the current status of all lines and sites of a half duplex (HDX) network configuration.

► **HELP [ command name  
topic-name ]**

Accesses online information about commands or topics you specify. If you type **HELP** without specifying a command or a topic, the system displays a list of all commands and topics included in the on-line **HELP** facility.

► **HPSD**

**HPSD** loads a version of **PSD** (Prime Symbolic Debugger) that is stored in the upper portion of memory. See the **Loading and Debugging Programmer's Companion**.

► **INPUT pathname**

Opens **pathname** for reading on file unit 1. Equivalent to **OPEN pathname 1 1**.

## ► JOB

Submits and controls jobs for Batch execution

### SUBMITTING JOBS

JOB { filename } [ options ]  
      { job-id }

Option	Meaning
-ACCOUNTING information	Allows you to specify accounting information for your job
-ARGS cpl-arguments	Passes CPL arguments to the job being processed ARGS must be the last option issued on a command line. Everything that follows on that line (except comments) is assumed to be CPL arguments being passed
-CPL	Runs the submitted file as a CPL file no matter what the file's name is. Not needed if -ARGS is used or if <b>file-name</b> ends with " CPL"
-CPTIME { seconds } { NONE }	Specifies the maximum amount of CPU time (in <b>seconds</b> ) for the job. NONE requests that no limit be placed on the job
-ETIME { minutes } { NONE }	Specifies the elapsed time allowed (in <b>minutes</b> ) before the job is aborted
-FUNIT number	Specifies the file unit for command input
-HOME pathname	Specifies the UFD in which a job runs. The pathname for a -HOME option cannot be null or begin with *)
-PRIORITY value	Determines the job's priority within its queue. Possible <b>values</b> are 0 to 9, with 9 as the highest (most favored) priority

Option	Meaning
<b>-QUEUE queue-name</b>	Allows you to specify the name of the queue in which your job is placed. Default is first queue available.
<b>-RESTART</b> $\left\{ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right\}$	Determines whether a job can or cannot be restarted following an ABORT or a system shutdown. (Default is always <b>-RESTART YES</b> .)

To specify any or all of the above options within the command input or CPL file itself, use the format

**\$\$JOB**     $\left\{ \begin{array}{c} * \\ \text{user-name} \end{array} \right\}$     **[ options ]**

If **\*** is used, any user can submit the file to Batch, otherwise only people logged in as **user-name** can submit it.

## MONITORING JOBS

**JOB**     $\left[ \begin{array}{l} \text{job-id} \\ \text{jobname} \end{array} \right] \quad \left\{ \begin{array}{l} \text{-STATUS} \\ \text{-DISPLAY} \end{array} \right\}$

Option	Meaning
<b>job-id</b>	A five-digit number preceded by a # assigned to a job by the monitor when the job is placed in the queue. Use <b>job-id</b> to request information on one job only.
<b>jobname</b>	The name of the file being run. If the job was submitted as a pathname (e.g. <b>JOB FELLOWSHIP&gt;HOBBITS&gt;FRODO</b> ) its <b>jobname</b> is the final element of the pathname (e.g. <b>FRODO</b> ). Use <b>jobname</b> to request information on multiple submissions of a file. If you omit <b>jobname</b> and <b>job-id</b> <b>JOB</b> requests information on all of your jobs.

<i>Option</i>	<i>Meaning</i>
<b>-STATUS</b>	Prints out the job's <b>jobname</b> and <b>job-id</b> the name of the queue it is in and its execution status whether it is held, waiting, or running
<b>-DISPLAY</b>	Provides status information and values for all JOB and \$\$ JOB command options (except -HOME) specified by you and for those assumed from queue defined defaults

## CONTROLLING JOBS

JOB job-id  $\left\{ \begin{array}{l} \text{-ABORT} \\ \text{-CHANGE [ options ]} \\ \text{-CANCEL} \\ \text{-RESTART} \end{array} \right\}$

<i>Option</i>	<i>Meaning</i>
<b>-ABORT</b>	Terminates the execution of a running job and cancels a held or waiting job
<b>-CANCEL</b>	Prevents the execution of held or waiting jobs. Canceling a running job does not halt its execution but marks the job as not restartable
<b>-CHANGE</b>	Allows you to change the -ACCT -ARGS -CPTIME, -ETIME -FUNIT -HOME or -RESTART options on a waiting job (-CPL, -QUEUE and -PRIORITY cannot be changed)
<b>-RESTART</b>	Terminates and then restarts a job

### ► LABEL MTn [ options ]

Writes an IBM or ANSI COBOL level 1 volume label on a magnetic tape Reads existing VOL1 and HDR1 labels The magnetic tape unit (**MTn**, where **n** is unit number 0-7) must have been assigned with the ASSIGN command **options** can be selected from the list below

#### -TYPE type

May have one of three values

<b>A</b>	9-track ASCII (ANSI, default)
<b>B</b>	7-track BCD (IBM)
<b>C</b>	9-track EBCDIC (IBM)

$\left\{ \begin{array}{l} \text{-VOLSER} \\ \text{-VOLID} \\ \text{-VOLUME} \end{array} \right\} \text{volume-id}$

Supplies a 1-16 character name for the tape

#### -OWNER owner-id

Supplies a 1-14 character owner name (Default is user's user id )

#### -ACCESS access

Supplies 1 character access indicator (Ignored by PRIMOS Default is a blank )

#### -INIT

Must be used when a brand-new tape is mounted

To read existing labels from magnetic tape, use the format

**LABEL MTn [ -TYPE type ]**

### ► LATE

Defers execution of the next command until a later time The PRIMOS response asks "Time of day (HHMM) to execute next command " This is useful for causing batch files to run at a later time Giving a time earlier than the current time defers execution until the following day The terminal cannot be used for any other purpose until after the time specified Use CONTROL-P to escape

► **LD** [ **pathname** ] [ **wild1** **wild15** ] [ **options** ]

Lists directory contents of **pathname** and, optionally the various directory entry attributes **pathname** specifies both the directory to be listed, and the first wildcard name, **wild1...wild15** are additional wildcard names. By default LD sorts entries alphabetically by name within the entry type, then sorts types in the following order: file, segment directory, directory, access category. A header precedes each type, identifying the type and the number of entries of that type. Output pauses after every 23 lines and LD displays a **--More--** prompt and awaits a response. Type **QUIT** or **NO** to leave LD, any other character continues the listing. **options** can be selected in any order from the list below.

**-BRIEF**

Confines top header to one line, suppresses column headers, and suppresses blank lines before **More--** prompt.

**-CATEGORY\_PROTECTED** [ **name** ]

Lists only entries protected by access categories. If **name** is given, lists only the entries protected by the access category identified by **name**.

**-DEFAULT\_PROTECTED**

Lists only the entries protected by default access control.

**-DETAIL**

Lists all attributes for each entry you select, on two lines after the entry name, in the following order: access rights, entry size, delete protection switch, date/time modified, type of access protection, entry type, entry quota, concurrency lock setting, incremental dump switch, and date/time saved (currently \*\* not set \*\*).

- DTM**  
Prints only the date/time modified information for each entry
- DTS**  
Reserved for future use
- NO\_HEADER**  
Suppresses all header lines.
- NO\_SORT**  
Does not sort entries by type
- NO\_WAIT**  
Suppresses pause and - More-- prompts
- PROTECT**  
Prints only the protection information for each entry, including access rights, delete-protection switch, and type of protection
- REVERSE**  
Reverses the sort order from its default Does not affect the sort order of entry types
- SINGLE\_COLUMN**  
Prints the name of entries one per line Useful only if the default format (names only) is used
- SIZE**  
Prints size information for each entry
- SORT\_DTM**  
Sorts entries by descending date/time modified within their type Incompatible with -SORT\_DTS, -SORT\_NAME, and -SORT\_SIZE
- SORT\_DTS**  
Reserved for future use
- SORT\_NAME**  
Sorts entries alphabetically by name only, not within their type Incompatible with -SORT\_DTM, -SORT\_DTS, and -SORT\_SIZE
- SORT\_SIZE**  
Sorts entries by descending size within type, and displays size of all entries except access categories Incompatible with -SORT\_DTM, -SORT\_DTS, and -SORT\_NAME

## **-SPECIFIC\_PROTECTED**

Lists only the entries protected by specific ACLs

## **-WIDE**

Displays output in wider than normal 79 character lines. Uses 100 character lines for name only output otherwise assumes name and associated attributes fit on one line. Useful for line printer output

You can also use command processor options such as **-FILE** or **-DIRECTORY** to select entries by type

### ► **LISTING** *pathname*

Opens a file for writing on file unit 2. Equivalent to **OPEN** *pathname* 2 2

### ► **LIST\_ACCESS** [ *object* ]

Lists access rights of the named *object* or of the current directory if you do not name an *object*. If *object* is an access category its ACL is displayed. If *object* is a file or directory the ACL or ACLs protecting it are displayed. If *object* is on a partition with priority access in effect the priority access is listed.

### ► **LIST\_GROUP**

Lists ACL groups to which you belong

### ► **LIST\_PRIORITY\_ACCESS** *disk-name*

Lists the priority access on any given disk partition

### ► **LIST\_QUOTA** [ *pathname* ] [ **-BRIEF** ]

Lists current disk quota and storage information for *pathname* or for your current directory if no *pathname* is given. The **-BRIEF** option displays a one line summary

### ► **LIST\_REMOTE\_ID** [ **-ON** *nodename* ]

Displays the user and project id's set up by previous **ADD\_REMOTE\_ID** commands. The **-ON** *nodename* option lists only the id for the named system

► **LIST\_VAR [ variable-name [ variable-name ] ]**

Lists named variables and their values from an active global variable file **variable-name** can be a wildcard name If no **variable-name** is given, **LIST\_VAR** lists all the variables in the file

► **LOAD**

Invokes the Linking Loader Loads programs for R-mode code generated by PMA, FORTRAN, or RPG II To load segmented code use the command **SEG** For complete information see the **SEG and LOAD Reference Guide**

► **LOGIN [ user-id [ password ] [ -ON nodename ] ]**  
**[ -PROJECT project-id ]**

Allows you to start work on the system Your **user-id** identifies you To log in to a remote system, use the **-ON nodename** option The System Administrator may require you to specify your **password** and **project-id** The SA may also require **password** to be entered on the next line

► **LOGOUT [ uu ]**

Logs you out With **-uu**, logs out user or phantom user number **uu** User **uu** must have your user id

► **LON [ -ON ]**  
**[ -OFF ]**

Enables or disables the printing of phantom logout notification messages **LON -OFF** defers messages until **LON -ON** (the default) is given

► **MAGNET [ -SILENT ] [ -USER ]**  
**[ -OPERATOR ]**

Reads writes and/or copies non-Prime format magnetic tapes to and from PRIMOS disk files Options follow

Option	Meaning
<b>-SILENT</b>	Prints only severity 2 and 3 errors
<b>-USER</b>	Displays mount or dismount messages at your terminal
<b>-OPERATOR</b>	Displays mount or dismount messages at the supervisor terminal

#### Note

MAGNET is not an archiving or system backup facility. For archiving, use MAGSAV and MAGRST, for system backup use MAGSAV and MAGRST or PHYSAV and PHYRST.

For complete information, see the **Magnetic Tape User's Guide**.

#### ► **MAGRST[ -7TRK ][ -TTY ]**

Restores files, directory-trees, or partitions from a magnetic tape created with MAGSAV. The tape unit must be assigned. The -7TRK option specifies 7-track tape. (Default is 9-track.) The -TTY option takes the tape unit number from your terminal, and all other information from the current input stream (for example, CPL or command files).

MAGRST queries and possible responses are:

#### **TAPE UNIT**

Physical unit number of the tape (0-7)

#### **ENTER LOGICAL TAPE NUMBER:**

- 0** The logical tape is already positioned
- 1** Rewinds and positions the first logical tape
- 2** Rewinds and positions the second logical tape
- etc.**

### **READY TO RESTORE:**

**\ES** Restores the entire tape

**\NO** Requests the new tape drive and logical tape numbers

**PARTIAL** Restores part of the tape

**\$I [ pathname ] [ level ]** Displays an **n** level index of all files and directories restored or writes the index into **pathname** (**level** default prints 2 levels )

**NW [ filename ] [ level ]** Prints an **n**-level index into the file or at the terminal but does not restore anything to disk (**level** default prints all levels )

**\$A pathname** Changes the home UFD

### **TREE NAME**

Enters the treename for a partial restore Ends with a blank line

### **\* [ options ]**

Writes a PRIMOS disk file, directory-tree, or disk partition to 7- or 9-track magnetic tape The tape unit must be assigned

Option	Meaning
<b>-LONG</b>	Uses 2048-byte records
<b>-VAR</b>	Allows variable length records, up to 4096 bytes (Default)
<b>-P300</b>	Uses 1024-byte records
<b>-INC</b>	Indicates an incremental dump, only the files and directories with the DUMPED switch set to zero are saved (Same as command \$INC ON )
<b>-UPDT</b>	Sets the DUMPED bit on all files saved (Same as command \$UPDT ON )
<b>-7TRK</b>	7-track tape format (Default is 9 track )
<b>-SUFD</b>	Always saves directories Useful only with the -INC option

Option	Meaning
-TTY	Takes the tape unit number from the terminal and all other information from the current input stream
-NO_ACL	Does not save any ACLs or ACL references

MAGSAV queries and possible responses are

### **TAPE UNIT**

Physical unit number of the tape (0-7)

### **ENTER LOGICAL TAPE NUMBER**

- 0 The logical tape is already positioned
- 1 Rewinds and positions the first logical tape
- 2 Rewinds and positions the second logical tape
- etc

### **TAPE NAME**

Any name up to six characters

### **DATE**

Valid date in format **mm dd yy** (Default is current date from PRIMOS )

### **REV NO**

Any number Must be integral

### **NAME OR COMMAND**

Filename to be saved, or one of the following

- \$A pathname** Changes the home UFD
- \$Q** Terminates the logical tape and returns to PRIMOS
- \$R** Does a \$Q and rewinds the tape
- \$I [ pathname ] [ level ]** Prints an index **pathname** writes the index into the named file The default prints the index on the terminal **level** specifies the level of the index The default prints two levels
- MFD** Saves an entire disk (Must be attached to MFD )

Saves the contents of the current directory

- \$UPDT { ON } { OFF }** Sets the dumped bit (Default is OFF ) Same as the option -UPDT
- \$INC { ON } { OFF }** ON saves only files and directories with the DUMPED switch set to zero (Default is OFF ) Same as the -INC option

► MESSAGE [ **username** ] [ -NOW ] [ -ON **node** ]

**text of message**

Sends a one-line message. **username** sends **text of message** to all users who are receiving messages and are logged in under that name. **-username** sends text only to the user with that user number. If neither **username** nor **-username** is given, **text of message** is sent to the operator. **-NOW** sends **text of message** immediately to the recipient's screen. Otherwise, **text of message** appears when the recipient next returns to command level. The **-ON node** option sends **text of message** to a user at a remote site.

Other forms of the MESSAGE command determine or check receive states, as follows.

#### MESSAGE -ACCEPT

Enables reception of all messages

#### MESSAGE -DEFER

Accepts deferred messages, inhibits **-NOW** messages

#### MESSAGE -REJECT

Inhibits all messages

MESSAGE -STATUS [ **username**  
**usernumber**  
ML ]

Lists receive states of specified users. If no user is specified, lists receive states of all users.

You cannot send messages while in the **-REJECT** state; you cannot use the **-NOW** option while in the **-DEFER** state.

► MRGF **file-a file-b [ file-c...file-e ] -OUTF ofile**

[ **-BRIEF**  
**-MINL number**  
**-FORCE**  
**-REPORT pathname** ]

Merges up to five files (file-a through file-e) into a single output file, **ofile**. Note that **-OUTF** must appear on the command line.

Option	Meaning
<b>-BRIEF</b>	Suppresses the printing of differing lines
<b>-MINL number</b>	Specifies the minimum number of lines that must match for resynchronization (Default is 3 )
<b>-FORCE</b>	Uses <b>file-b</b> to resolve conflicts (rather than asking you)
<b>-REPORT pathname</b>	Outputs differing lines to <b>pathname</b> instead of printing them on the terminal

#### ► NCOBGI

Runs the nonshared COBOL compiler Options and defaults are the same as those for the shared COBOL compiler COBOL Rarely used

#### ► NETLINK [ options ]

Connects you to any system on the Public Data Network The basic procedure is

- 1 Enter NETLINK Command mode by giving the NETLINK command When Command mode is entered the @ prompt appears
- 2 Connect to the remote system by giving the NC address or C address command **NC** means no reverse charge (required for many international calls) **address** is either the host address assigned by the Public Data Network or a PRIMENET system name For example both NODE1 and 409522 are valid addresses

For international calls use the following format  
country identifier host address For example  
2080 12300011

When a connection has been established the message address Connected appears

- 3 Log in to the system as you would normally enter any validation codes as required

4 Once you finish a terminal session, log out as you would normally. The message “address Disconnected” appears. When a connection to a remote host has been terminated by logging out, command mode is reentered and the @ appears. You can now connect to another site or return to PRIMOS.

5 To return to PRIMOS, type QUIT.

For full details on NETLINK and its options, see the **PRIMENET Guide**.

#### ► NSED

NSED is the nonshared version of the text editor. It is identical in function to ED, the shared editor. PRIMOS II, which does not support the shared editor, can use NSED.

#### ► NUMBER

Numbers or rennumbers the statements in a BASIC program. Asks for the pathnames of input and output files, and for values (1-1999, default is 1) for starting and incrementing the statement numbers.

#### ► OAS

Starts up Prime's Office Automation System (OAS).

#### ► OA\_ADMIN

Allows the OAS Administrator to create and maintain master OAS files.

#### ► OA\_TERM

Downline loads the PT65 Terminal (Administrative Workstation) for Office Automation.

#### ► OPEN [ pathname ] funit key

Opens **pathname** on the specified file unit **funit**. The value of **key** is the logical OR of an action key, a reference key, and a new file key. Use octal values for **funit** and **key**. Commonly used keys follow.

**Action Key****Meaning****1**

Open for reading

**2**

Open for writing

**3**Open for reading and  
writing**New File Key****Meaning****0000**

Sequential file (SAM)

**2000**

Direct access file (DAM)

**➤ O<sup>2</sup>IGIN**

Changes your home and current attach point to your origin directory (initial attach point at login)

**pathname [ options ]**

Runs the PASCAL compiler For information, see the **PASCAL Reference Guide** or the online HELP facility

**PASSWD [ owner-password [ nonowner-password ] ]**

Changes the owner and nonowner passwords of the current passworded directory The user must have owner rights The defaults are blank owner and null nonowner (See the SET ACCESS command for access control on an ACL directory )

**➤ PHANTOM pathname [ CPL-arguments ]**  
**funit**

Runs the command file or CPL program **pathname** as a phantom user **funit** cannot be used with CPL programs The default **funit** for COMINPUT files is 6

**pathname [ options ]**

Runs the PL/I Subset G compiler For information, see the **PL/I Subset G Reference Guide**.

**M**

Displays the contents of the RVEC user register vector

See also DMSTK

► **PMA *pathname* [ options ]**

Runs the Prime Macro Assembler For more information, see the **Assembly Language Programmer's Guide**.

► **PRERR**

Useful only for debugging obsolete programs Displays the ERRVEC message set by the ERRSET subroutine, and the first six octal locations in ERRVEC, or prints ERRVEC and the last error message

► **PRMP(*pathname***

Prints ***pathname*** on an MPC parallel interface printer (PR*n*) previously assigned

See also SPOOL

► **PROP { -STATUS  
printer-name -DISPLAY }**

Displays a list of all printers on the current system, telling which ones are running and which are not. -DISPLAY gives the following information.

Parameter	Meaning
<b>DEVICE:</b>	Displays the name of the device the phantom controls (Can be used in the SPOOL -AT option )
<b>PAPER:</b>	Names the type of paper mounted on the printer (Blank signifies the default type )
<b>FORM:</b>	Lists synonyms for PAPER (Can be used with SPOOL -FORM option ) If no synonyms exist, FORM does not appear.
<b>DEST:</b>	Lists synonyms for <b>printer-name</b> (Can be used with SPOOL -AT option ) Appears only if the System Administrator has established a list of synonyms

<i>Parameter</i>	<i>Meaning</i>
<b>MESSAGE</b>	Prints this message on each header page
<b>COMOUT</b>	If on the phantom is keeping a COMOUTPUT file of its activities
<b>UPCASE</b>	If on the printer prints all characters as uppercase If off it prints both upper and lowercase
<b>PRINT:</b>	If on the printer processes print requests
<b>PLOT:</b>	If on the printer processes plot requests (Device must be PLOT )
<b>LENGTH</b>	Shows the number of lines printed per page
<b>LARGE</b>	Gives priority in the spool queue to files of less than this number of records
<b>LIMIT</b>	Does not print files exceeding this number of records
<b>UPPER</b>	Sets the highest logical disk on which the phantom looks for SPOOLQ UFDs
<b>LOWER</b>	Sets the logical disk on which the phantom begins to search for SPOOLQ UFDs
<b>HEADER:</b>	Sets the number of header pages to be printed
<b>WIDTH</b>	Sets the number of columns per page
<b>LINES</b>	Sets the actual number of lines per page ( off represents default length which is LENGTH plus 13 lines )

### ► **PROTECT** *pathname*

[ **owner-code** [ **non-owner-code** ] ] [ **-REPORT** ]

Sets protection rights for password protected files directories and segment directories specified by **pathname**. The **-REPORT** option reports the results of each successful setting of protection rights. (Note that **PROTECT** uses mnemonic protection codes and is not the same as the pre Rev 19 **PROTEC** command.)

Owner and nonowner codes designate various types of protection as follows

Code	Description
<b>NIL</b>	No access of any kind (Default)
<b>R</b>	Read access only
<b>W</b>	Write access only
<b>D</b>	Delete access only
<b>RW</b>	Read and write access only
<b>RD</b>	Read and delete access only
<b>WD</b>	Write and delete access only
<b>RWD</b>	All rights (read write and delete)

### ► **PRSER** *pathname*

Prints **pathname** on the serial interface printer (CENPR CE2PR) previously assigned

### ► **PRVER** *pathname*

Prints **pathname** on a configured printer/plotter (PLOT) previously assigned

### ► **PSD**

Loads and starts the Prime Symbolic Debugger (PSD20 is a version of PSD of 16K PRIMOS II). For details see the **PMA Reference Guide**

► **PTELE**

Accesses the Office Automation System (OAS) Telephone Inquiry function

► **RDY [ option 1 ][ option 2 ]**

Allows you to choose the prompt messages you want displayed at your terminal and in COMOUTPUT files.

<i>Option</i>	<i>Function</i>
<b>-LONG</b>	Switches to the long format of the prompt message giving the time of day, and the CPU and I/O times since the last prompt
<b>-BRIEF</b>	Switches to the short format (Default at login)
<b>-OFF</b>	Suppresses prompt messages
<b>-ON</b>	Reenables the printing of prompt messages Unless the <b>-LONG</b> or <b>-BRIEF</b> option is given with the <b>-ON</b> option, messages appear in the format last specified
<b>-READY_LONG text</b>	Changes the text portion of the long ready message to <b>text</b> The default at login time is "OK"
<b>-READY_BRIEF text</b>	Changes the text portion of the brief ready message to <b>text</b> The default at login time is "OK"
<b>-ERROR_LONG text</b>	Changes the text portion of the long error message to <b>text</b> The default at login time is "ER".
<b>-ERROR_BRIEF text</b>	Changes the text portion of the brief error message to <b>text</b> The default at login time is "ER'" <b>text</b> can be up to 20 characters

## ► REN

Reenters a subsystem following a QUIT or an error condition. If no on-unit exists in the subsystem, REN returns you to PRIMOS command level.

## ► RESTOR **pathname**

Restores the runfile **pathname** from disk to memory.

## ► RESUME **pathname** [ **arguments** .. ]

Executes both R-mode runfiles and CPL programs contained in **pathname**. CPL programs define the arguments. Runfiles use the following to set new values for the RVEC:

[ **p** ][ **a** ][ **b** ][ **x** ][ **keys** ][ **program arguments**. ]

Do not use RESUME for 64V segmented mode programs, use SEG instead.

## ► REVERT\_PASSWORD

Converts your current directory from an ACL directory to a password directory. The current directory must not contain ACL directories or access categories.

## ► RJQ

The RJQ command has five different command line formats. One builds a concatenated file, others queue files for transmission to a remote site, list queue entries, cancel entries, or restart aborted file transmissions. RJQ replaces the obsolete RJ1004, RJ7020, RJX80, RJGRTS, RJHASP, and RJ200UT commands. For detailed information on the various forms of this command, see the **Remote Job Entry Phase II Guide**.

► **RLS [ option ]**

Discards unwanted stack history.

<i>Option</i>	<i>Meaning</i>
<b>-ALL</b>	Releases the entire stack
<b>-TO n</b>	Releases stack levels down to level <b>n</b> . <b>n</b> must be a positive decimal integer, and must be less than the current level number
<b>-LEVELS n</b>	Releases <b>n</b> levels. Must be positive decimal integer such that the current level minus <b>n</b> is less than or equal to 1. (Default is <b>-LEVELS 1</b> )

► **RPG pathname [ options ]**

Runs the RPG II R-mode compiler. For detailed information, see the **RPG II Programmer's Guide**.

► **RSTERM [ -READ ] [ -WRITE ]**

Empties the user terminal's read (input) and/or write (output) buffers. Specifying no option empties both buffers.

► **RUNOFF [ pathname ]**

Processes the file **pathname** (assumed to be in RUNOFF input form) to create an output file of formatted text. See the **New User's Guide to EDITOR and RUNOFF** for detailed and tutorial information.

► **RWLOCK pathname lock [ -REPORT ]**

Sets the read/write concurrency lock on a file or segment directory to control the number of users at one time. **pathname** gives the file system object to be protected (can be a wildcard). **lock** identifies the concurrency lock to be set on the file system object. May take one of the following four values:

Option	Meaning
<b>SYS</b>	Uses the system read/write lock (Default)
<b>EXCL</b>	Allows N readers OR one writer
<b>UPDT</b>	Allows N readers AND one writer
<b>NONE</b>	Allows N readers and N writers

–REPORT displays results for each successful lock setting To use RWLOCK, you need owner access to a password directory, or protect (P) access to an ACL directory

► **SAVE** *pathname* [ *sa* ] [ *ea* ] [ *pc* ] [ *a* ] [ *b* ] [ *x* ]  
[ *keys* ]

Saves memory (segment '4000) from **sa** (start address) to **ea** (end address) as the file **pathname** The other values are the RVEC parameters If not specified, they default to current RVEC values Not for 64V segmented runfiles, use SEG's SAVE subcommand instead

► **SEG** [ **pathname** ]  
[ **-LOAD** ]

Creates or executes V-mode and I-mode runfiles With **pathname**, excutes the V-mode or I-mode runfile named in **pathname**. With **-LOAD** creates a new V-mode or I-mode runfile

For a complete discussion of SEG, see the **SEG and LOAD Reference Guide**.

► **SET\_ACCESS** *target* [ **acl** [ **-NO\_QUERY** ]  
[ **-LIKE** *reference*  
[ **-CATEGORY** *category-name* ] ] ]

Specifies access rights for the file, directory, or segment directory given in **target**. If **target** does not exist, a new access category is created With no options, use the default access for the parent directory The command line options follow

<i>Option</i>	<i>Meaning</i>
<b>acl</b>	Defines, creates, and sets an ACL, or queries before it replaces an ACL. The format for <b>acl</b> is <b>identifier: rights</b> <b>[ ...identifier: rights ]</b> <b>identifier</b> is either a user id, an ACL group name, or the string \$REST. <b>rights</b> are NONE (no rights), ALL (all rights), or any combination of P (protect), D (delete), A (add), L (list), U (use), R (read), and W (write).
<b>-LIKE reference</b>	Gives <b>target</b> the same protection as <b>reference</b> .
<b>-CATEGORY category-name</b>	Protects <b>target</b> with the existing access category <b>category-name</b> .
<b>-NO_QUERY</b>	Suppresses the query generated in replacing an existing ACL. Used only when specifying both <b>target</b> and <b>acl</b> .

► **SET\_DELETE pathname [ -PROTECT -NO\_PROTECT ]**

Prevents accidental deletion of the file, directory, or segment directory given in **pathname**. **-PROTECT** ensures that a user trying to delete an object is queried before the object is deleted. This is the default. **-NO\_PROTECT** allows deletion without query by PRIMOS.

► **SET\_QUOTA pathname [ -MAX n ]**

Sets the maximum record quota on the directory or subdirectory given in **pathname**. Omitting **-MAX n** removes a quota, and is the same as setting **n** to zero.

► **SET\_VAR name [ ] value**

At command level, defines a global variable and places it and its value in the global variable file **name** is any legal variable name up to 32 characters long Names of global variables must begin with a dot ( ) **value** can be

- A character string At command level the string must be short enough so that the entire command line does not exceed 160 characters In CPL programs the string can be up to 1024 characters long A string must be enclosed in single quotes if it contains blanks or special characters The single quotes are included in the character count
- A numeric character string representing an integer between the values of  $-2^{31}$  to  $2^{31} - 1$
- A character string consisting of the logical value TRUE or FALSE

Inside a CPL program SET\_VAR sets the value of global or local variables

► **SIZL pathname [ -NORM ]**

Displays the size of the file, segment directory, UFD or access category given in **pathname** -NORM displays size in 880-byte records (The default is 2048 byte records ) SIZE displays different units for different entry types For files it displays the number of records in the file For UFDs and segment directories it displays the number of top-level entries For access categories it displays the number of entries in the access category

► **SLIST [ pathname ]**

Displays file contents at the terminal

## ► **SORT [ options ]**

Sorts ASCII, variable-length, or fixed-length files  
Requests input and output filenames, number of  
columns and starting and ending columns. Allows  
up to 64 sort keys. The maximum logical record is  
32760 bytes. The maximum key length is 312 char-  
acters.

The default SORT is straight ASCII (upper- and  
lowercase are sorted differently). Other sort types  
are shown below. Put a space and the key type sym-  
bol after the column numbers of the sort field. Put a  
space and R after the column numbers of any field  
to be reverse-sorted.

<i>Option</i>	<i>Meaning</i>
<b>-BRIEF</b>	Suppresses printing of SORT program messages at the terminal.
<b>-SPACE</b>	Deletes any blank lines from the SORT output file.
<b>-MERGE</b>	Merges a maximum of ten unsorted files at a time. The SORT program asks for the number of files to be merged. Types their names one per line.
<b>-TAG</b>	Requests a TAG sort. -TAG is the default. It is faster than -NONTAG for large or unordered files.
<b>-NONTAG</b>	Requests a NONTAG sort, often preferred for small or well ordered files.

## SORT INFORMATION

<i>Code</i>	<i>Key Type</i>	<i>Definition</i>
<b>A</b>	ASCII (default)	Character strings stored one character per byte String length is limited only by the length of the record
<b>I</b>	Single-precision integer (short)	Length is 2 bytes, range is $-32767$ to $+32767$
<b>J</b>	Double-precision integer (long)	Length is 4 bytes, range is $-2^{31}$ to $+2^{31} - 1$
<b>F</b>	Single-precision real	Length is 4 bytes, range is $\pm (10^{-38}$ to $10^{38})$
<b>D</b>	Double-precision real	Length is 8 bytes, range is $\pm (10^{-9902}$ to $10^{9825})$
<b>U</b>	Numeric ASCII, unsigned	Like plain ASCII. These are stored one digit per byte and are limited only by the length of the record
<b>LS</b>	Numeric ASCII, leading separate sign	Numbers are preceded by '+' or '-' to indicate positive or negative value (A blank space is treated as a positive sign)
<b>TS</b>	Numeric ASCII, trailing separate sign	Same as LS except that the '+' or '-' follows the number
<b>LE</b>	Numeric ASCII, leading embedded sign	One digit per byte. Alphabetic characters can represent digits, as shown in the insert table below. The first character represents both a digit and the sign of the field (e.g. L579 represents -3579)

Code Key Type		Definition		
<b>LE (cont )</b>		Digit	Positive	Negative
		0	0 - + , {	} -
		1	1A	J
		2	2B	K
		3	3C	L
		4	4D	M
		5	5E	N
		6	6F	O
		7	7G	P
		8	8H	Q
		9	9I	R
<b>TE</b>	Numeric ASCII trailing embedded sign	Same as LE except that the last digit carries the sign (e g 357R represents - 3579)		
<b>PD</b>	Packed decimal	A 4 bit nibble represents each digit the number ends with a sign nibble A negative sign is represented by the hex D in the sign nibble any other value in the sign nibble indicates a positive number A packed field must have an odd number of digits plus the sign Because they are stored 2 nibbles (digit or sign) per byte this is a full number of bytes Packed decimal keys can be up to 63 digits plus a sign		
<b>AU</b>	ASCII, upper- and lowercase sort	Storage is identical to regular ASCII Lowercase characters are sorted as uppercase then put into the output file as lowercase		
<b>UI</b>	Unsigned integer	Length is 2 bytes, range is 0 to 65535		

SORT information can also be given with keywords as follows

## Specifying filenames and types:

Keyword	Usage
<b>-INPUTFILE name</b>	Specifies a file to be sorted <b>name</b> can be a pathname of up to 80 characters Repeat this keyword for each input file
<b>-OUTPUTFILE name</b>	Creates a file to hold the sorted output Only one output file per sort is allowed
<b>KEYS n</b>	<b>n</b> is the number of keys for the sort
<b>-INTYPE</b> <b>{ COMPRESSED</b> <b>  UNCOMPRESSED</b> <b>{ FIXED</b> <b>  VARIABLE }</b>	Specifies the type of file(s) to be sorted All input files must be of the same type If this keyword is not given, a default file type is taken from the key type
<b>-OUTTYPE type</b>	Specifies file <b>type</b> for the output file Types are the same as those for input files If this keyword is not given, the output file will have the same type as the input file(s)
<b>-INLENGTH n</b>	Gives the maximum length of the input records (in bytes) (The greatest possible <b>n</b> is 32760 bytes the default ) This keyword must be given for fixed-length records
<b>-OUTLENGTH n</b>	Specifies the maximum length for records in output file Defaults to the length of the input record If you specify a fixed-length record output file you must also specify the record length

## Specifying keys

Keyword	Usage
<b>-START n</b>	<b>n</b> is first column of the key
<b>-END n</b>	<b>n</b> is last column of the key
<b>-DESCENDING</b>	Requests a sort in descending order
<b>-TYPE code</b>	Any of the codes from the table of key types, above
<b>-EBCDIC</b>	Uses an EBCDIC collating sequence for sorting (used only with A or AU key types)

### ➤ **SPOOL [ pathname ] [ options ]**

Queues disk files for the line printer or the plotter

Option	Meaning
<b>-AS alias</b>	Uses <b>alias</b> as <b>pathname</b> on the header and in the SPOOL -LIST displays
<b>-AT destination</b>	Prints only on the printer at the given destination
<b>-CANCEL [ PRT ]xxx</b>	Removes file <b>xxx</b> from the spool queue. Must be the last option on the command line. Can cancel more than one file. CANCEL 1 2 3
<b>-COPIES n</b>	Prints <b>n</b> copies of the file ( <b>n</b> < 99)
<b>-DEFER time</b>	Defers printing until <b>time</b> ( <b>hh mm</b> on a 24 hour clock or <b>hh mm</b> AM or PM on a 12 hour clock)
<b>-FORM name</b>	Prints on the specified paper type
<b>-ITN</b>	Obeys FORTRAN output conventions in the file

<i>Option</i>	<i>Meaning</i>														
<b>-LIST [ options ]</b>	Lists spool-queue entries Must be the last option on the command line														
	<table> <tr> <th><i>Option</i></th><th><i>Meaning</i></th></tr> <tr> <td><b>ALL</b></td><td>List all files (Default)</td></tr> <tr> <td><b>DEFER</b></td><td>Lists the deferred files</td></tr> <tr> <td><b>FORM [ type ]</b></td><td>Lists the forms of specified type Omit <b>type</b> for the default form</td></tr> <tr> <td><b>OWN</b></td><td>Lists the files spooled under your login name</td></tr> <tr> <td><b>PLOT</b></td><td>Lists the files in the plot queue</td></tr> <tr> <td><b>PRINT</b></td><td>Lists the files in the print queue</td></tr> </table>	<i>Option</i>	<i>Meaning</i>	<b>ALL</b>	List all files (Default)	<b>DEFER</b>	Lists the deferred files	<b>FORM [ type ]</b>	Lists the forms of specified type Omit <b>type</b> for the default form	<b>OWN</b>	Lists the files spooled under your login name	<b>PLOT</b>	Lists the files in the plot queue	<b>PRINT</b>	Lists the files in the print queue
<i>Option</i>	<i>Meaning</i>														
<b>ALL</b>	List all files (Default)														
<b>DEFER</b>	Lists the deferred files														
<b>FORM [ type ]</b>	Lists the forms of specified type Omit <b>type</b> for the default form														
<b>OWN</b>	Lists the files spooled under your login name														
<b>PLOT</b>	Lists the files in the plot queue														
<b>PRINT</b>	Lists the files in the print queue														
<b>-LNUM</b>	Generates line numbers Incompatible with <b>-FTN</b> option														
<b>-NOFMT</b>	Disables the normal spooler control (header generation/pagination) You must insert your own line-printer control modes														
<b>-NOHEAD</b>	Does not print any header or trailer pages														
<b>-OPEN</b>	Opens the print file in the queue for writing on the TO-unit														
<b>-PLOT [ nwords ]</b>	Indicates the plot file <b>nwords</b> is the decimal number of words to be read and output per raster scan (The default is 128 for 200 raster/inch plotter )														
<b>-TUNIT unit</b>	Specifies the TO-unit (1-126) (The default is 2)														

► **START** [ pc ] [ a ] [ b ] [ x ] [ keys ]

Starts execution of a static mode program (START assumes that the program is in memory) START initializes process registers and keys, then starts execution at **pc** If **pc** is not given, execution resumes at the point of interruption

► **STATUS**

ALL
DEVICE
DISKS
ME
NETWORK
PROJECT
SEMAPHORES
SYSTEM
UNITS
USERS
COMM

Displays user or system status, including user number, line number, disks in use, devices in use, priority level, and network connection, if applicable Defaults are information about PRIMOS version, units, disks, semaphores, network, and user ids, in that order

► **SVCSW**  $\begin{Bmatrix} 0 \\ 1 \end{Bmatrix}$

Sets the SVC switch, which controls handling of the SVC instruction in the virtual memory environment

- 0 SVC instructions are trapped and processed by PRIMOS (Default)
- 1 SVC instructions cause a virtual trap handled through the user's program location 65

➤ **TERM** {  
 -DISPLAY  
 -ERASE char  
 -KILL char  
 -BREAK ON  
 -BREAK OFF  
 -FULL  
 -HALF LF  
 -HALF NOLF  
 -NOXOFF  
 -XOFF

Sets terminal characteristics (Resets to the defaults at logout except for -HALF, -FULL )

-BREAK { ON } Enables or disables BREAK  
 { OFF } action of the BREAK key or  
 the CONTROL-P key

-DISPLAY Displays current terminal  
 characteristics

-ERASE char Sets the ERASE character  
 for PRIMOS

-FULL Full-duplex mode (Default)

-HALF [ LI Half-duplex mode LF  
 NOLF ] means do a line feed when  
 the carriage return is hit.  
 NOLF means do not do a  
 line feed

-KILL char Sets the new KILL character  
 for PRIMOS

-NOXOFF Disables the CONTROL-S/  
 CONTROL-Q keys

-XOFF Enables CONTROL S (halt)  
 and CONTROL-Q (resume)  
 keys for inspecting screen  
 output

➤ **TIME**

Displays connect time in hours and minutes, com-  
 pute and disk I/O time in minutes and seconds.

## ► TRAMLC

Transmits or receives a file over an assigned AMLC line between two Prime computer systems. Generally useful only when PRIMENET is not available. TRAMLC requests FNAME (pathname of the file), then requests T/R (transmit or receive), LINE # (number of the assigned AMLC line) and BLOCK (desired frequency of acknowledgment message). The TRAMLC command may be given first on either the transmitting or receiving computer.

## ► TYPE text

Prints **text** at the terminal or into a command output file. **text** can include variable references or function calls.

## ► UNASSIGN device

Releases **device** (or communications line) previously assigned. See ASSIGN for device names. All of a user's assigned devices are automatically unassigned at logout.

Magnetic tape drives may be unassigned either by physical device number or by their logical alias.

UNASSIGN MTpdn [ -UNLOAD ]

UNASSIGN -ALIAS MTldn [ -UNLOAD ]

The -UNLOAD option causes the tape to be rewound and unloaded.

## ► UPCASE in-pathname cut-pathname

Replaces lowercase letters in **in-pathname** with corresponding uppercase letters. Output is to **out-pathname**. UPCASE makes files suitable for output to devices with only uppercase alphabetic characters.

## ► USERS

Displays the number of current users.

► **VISTA**

Activates DBMS/QUERY, the Data Base Management System query language and report writer For detailed information see the **DBMS/ QUERY User's Guide** and the **DBMS/QUERY Reference Guide**.

► **VPSD, VPSD16**

Runs the Virtual-mode Prime Symbolic Debugger See the **Assembly Language Programmer's Guide** for details

► **VRPG pathname [ options ]**

Runs the RPG II V-mode compiler For detailed information, see the **RPG II V-mode Compiler Reference Guide**, or the online HELP facility

► **VRTSSW [ octal-number ]**

Sets virtual sense switches, and is available to the user's program via the INA '1620 (read sense switches) instructions (This feature retains compatibility with early programs that accessed the real control panel switches under PRIMOS II)

► **WP\_ADMIN**

Allows the OAS Administrator to create and maintain the Global Keyword List, which is used in the Document Keyword Indexing function

► **\$\$JOB { <sup>\*</sup>user-name } [ options ]**

Controls submission and execution of Batch jobs Must appear as the first line in the command file Options are the same as for the JOB command
